

# UI/UX CASE STUDY

## Digital Talent Management Platform

A Hiredly is a centralized system that helps organizations manage hiring, employee performance, and development efficiently through a user-friendly digital experience.

Figma Url: <https://www.figma.com/design/CJ6IINuDnQFDgpBuhqqcnB/Hiredly-Digital-Talent-Management-Platform?node-id=0-1&t=hlDuKcG1bXtpjcje-1>

ABOUT

Hiredly is a centralized digital platform that streamlines hiring, employee management, and performance tracking for organizations.

PROBLEM

Many companies rely on fragmented tools and manual processes for hiring and employee management. This leads to inefficient workflows, poor communication, and difficulty in tracking performance. As a result, organizations face low productivity and reduced employee satisfaction.

SOLUTION

Hiredly offers a centralized platform to manage recruitment, employee data, and performance efficiently. It simplifies workflows with intuitive dashboards, real-time tracking, and smart insights. This improves decision-making, enhances employee experience, and boosts overall productivity.

|                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 01                                                                                                                                                                | Problem                                                                                                                                                                                                                                                                                                    | Solution                                                                                                                                                                                                                                                                                                                  |

Define Target Users

1. HR Managers

- Manage employee data and performance
- Oversee hiring and onboarding

2. Recruiters

- Post jobs and screen candidates
- Schedule and manage interviews

### 3. Employees

- Track their performance and goals
- Access learning resources

### 4. Team Leads / Managers

- Monitor team productivity
- Provide feedback and evaluations

### Design Process

1. **User Research** – Interviews, surveys, competitor analysis
2. **Define** – Identify pain points & problem statement
3. **Ideation** – Brainstorm features & solutions
4. **Design** – Wireframes and UI design (Figma)
5. **Testing** – Usability testing & improvements

02

#### DESIGN PROCESS

## USER PERSONAS – HIREDLY:

### HR Manager (Priya Sharma)

Priya aims to streamline the recruitment process, manage employee data efficiently, and improve overall employee engagement within the organization. However, she struggles with too many manual tasks, difficulty in tracking candidate status, and the absence of a centralized system. She needs an easy-to-use dashboard with automated hiring workflows and real-time employee insights to simplify her work. Priya regularly uses HR tools, prefers desktop-based platforms, and is comfortable working with dashboards and analytics.

### Recruiter (Arjun Verma)

Arjun's primary goal is to find and hire the best candidates quickly while managing multiple job openings efficiently. He faces challenges such as manually sorting resumes, time-consuming interview scheduling, and poor communication with candidates. To overcome this, he needs a resume filtering system, an interview scheduling tool, and a candidate tracking system. Arjun actively uses job portals like LinkedIn, works on both mobile and desktop, and prefers a fast and responsive interface.

## Employee (Karthik R)

Karthik wants to track his performance, learn new skills, and grow in his career through promotions. However, he often experiences a lack of clear performance feedback, limited visibility into career growth opportunities, and difficulty accessing training resources. He needs a performance dashboard, a learning and development section, and a proper feedback system. Karthik prefers mobile apps, uses them daily, and values a simple and clean user interface.

## Team Lead / Manager (Rahul Mehta)

Rahul focuses on tracking team performance, assigning tasks effectively, and providing meaningful feedback to his team members. He finds it difficult to monitor team progress, relies on manual performance tracking methods, and lacks access to clear and structured reports. To improve efficiency, he needs a team performance dashboard, a goal tracking system, and detailed reporting tools. Rahul frequently uses dashboards, prefers data visualization for insights, and primarily works on desktop devices.

## Problem Statement

Organizations struggle with managing talent efficiently due to fragmented systems and manual processes across recruitment, employee management, and performance tracking.

HR teams and managers lack a centralized platform to monitor candidate progress, employee growth, and team performance in real time.

This results in inefficiencies, poor decision-making, reduced productivity, and a suboptimal employee experience.

04

### Problem Statement

Organizations struggle with managing talent efficiently due to fragmented systems and manual processes across recruitment, employee management, and performance tracking.

HR teams and managers lack a centralized platform to monitor candidate progress, employee growth, and team performance in real time.

This results in inefficiencies, poor decision-making, reduced productivity, and a suboptimal employee experience.

## Journey Map

Information here is based on answers recruiters gave during interviews.

The recruiter journey begins with job posting, where Arjun creates and publishes job openings with the goal of attracting suitable candidates, but faces challenges due to manual posting across multiple platforms—this can be improved through a one-click multi-platform posting feature. In the application review stage, he spends significant time filtering resumes manually to shortlist qualified candidates, which creates inefficiency; an AI-based resume screening system can streamline this process. During interview scheduling, Arjun aims to coordinate efficiently but encounters delays due to constant email back-and-forth, highlighting the need for an integrated scheduling system. In the candidate evaluation stage, he reviews interview feedback to select the best candidate, yet struggles with scattered data, making a centralized evaluation

dashboard a valuable solution. Finally, in the offer and hiring stage, Arjun sends offer letters to complete the hiring process but experiences delays in approvals, which can be resolved through an automated approval workflow that speeds up decision-making and improves overall efficiency.

05

## User Flow:

06

## User Flow

## Quantitative research

To design Hiredly effectively, both qualitative and quantitative research methods were used to understand user needs and behaviors. Qualitative research included user interviews and observations with HR managers, recruiters, and employees to identify pain points such as manual workflows, lack of centralized systems, and poor performance tracking. Quantitative research involved surveys and data analysis to measure common challenges, user preferences, and feature priorities across a larger audience. Together, these insights helped define key problems and guided the design of a user-centered, efficient, and scalable talent management platform.

06

## Quantitative research

To design TalentNest effectively, both qualitative and quantitative research methods were used to understand user needs and behaviors. Qualitative research included user interviews and observations with HR managers, recruiters, and employees to identify pain points such as manual workflows, lack of centralized systems, and poor performance tracking. Quantitative research involved surveys and data analysis to measure common challenges, user preferences, and feature priorities across a larger audience. Together, these insights helped define key problems and guided the design of a user-centered, efficient, and scalable talent management platform.

## Conclusion

The TalentNest platform addresses key challenges in talent management by providing a centralized, user-friendly solution for recruitment, employee tracking, and performance management. Through proper user research and UX design, the platform focuses on improving efficiency, decision-making, and overall user experience. Ultimately, TalentNest helps organizations streamline workflows, enhance employee growth, and achieve better productivity.

## Conclusion

The Hiredly platform addresses key challenges in talent management by providing a centralized, user-friendly solution for recruitment, employee tracking, and performance management. Through proper user research and UX design, the platform focuses on improving efficiency, decision-making, and overall user experience. Ultimately, Hiredly

helps organizations streamline workflows, enhance employee growth, and achieve better productivity.

## Wireframes:

<https://www.figma.com/design/CJ6IIINuDnQFDgpBuhqqcnB/Hiredly-Digital-Talent-Management-Platform?node-id=41-3186&p=f&t=2q6YV9PFi3TdKPJL-0>

Based on our findings, we created wireframes in Invision. While we were creating wireframes, the flow that guides the user through the process, was our priority. We replaced help messages with simple functional steps that help figure out how the extension should work. And new features were integrated to help users save their time.

## Low-Fidelity Wireframes

Focusing on the user journey, these wireframes replace wordy instructions with a functional, task-based flow. By stripping away visual distractions, we've optimized the

extension's interface to highlight time-saving features and clear navigational steps.

# UI CASE STUDY

UI Design:

Color Palette:

## Indigo Forge System.

### Color Philosophy

01 // SPECTRA

A visual language for the Digital Architect. Precision-engineered components, editorial typography, and tonal depth for high-performance career platforms.

## Typography Architecture:

This typography architecture balances an "engineered" aesthetic with human-centric usability by pairing the geometric Manrope for high-impact headlines with the neutral, highly legible Inter for functional body text. By utilizing a diverse weight scale—ranging from 40 Heavy to 14 Regular—and a strict rem-based hierarchy, the system ensures that "Editorial Intent" remains clear while dense technical data remains readable across various IDE resolutions. The high x-heights and deliberate spacing are specifically designed to reduce cognitive load in digital workspaces, creating a professional environment where precision and readability coexist seamlessly.

## Elevation & Depth:

The interface establishes a cohesive visual language by merging structural depth with high-fidelity interactive components, ensuring a seamless user experience in data-rich environments. Through the use of Tonal Stacking and Floating Overlays, the UI creates a multi-layered "strata" that organizes information by importance, while the Material Grain gradient adds a signature aesthetic touch. These structural layers support a robust system of Interactive Primitives, where high-contrast primary actions, rounded input fields, and dynamic progress tracks provide clear affordances and real-time feedback. Ultimately, this combination of tactile depth and functional precision transforms the digital workspace into an intuitive, responsive environment tailored for complex technical tasks.

## Interactive Primitives

04 // ACTIONS

BUTTON\_STATES

INPUT\_SYSTEM

PROGRESS\_TRACK

## Limitations in Mobile Design:

Users are currently restricted from attending assignments and coding challenges on mobile devices.

These features are only accessible through the web platform.

## Reason Behind the Restriction

This limitation is intentionally implemented to prevent proxy and malpractice activities during assessments.

- Mobile devices are harder to monitor securely
- Increased risk of cheating or external assistance
- Lack of controlled testing environment compared to desktop

# Spacing and Radius:

## 02. Border Radius

RADIUS\_TOKEN\_SET

Softening the technical edge with tactile curvature.

A technical precision framework for the Hiredly ecosystem. Built on structural integrity, tonal depth, and the principles of digital craftsmanship.

## 01. Spacing System

TOKEN\_SCALE\_8PT

The 8pt geometric progression for spatial harmony.

# Grid System Architecture:

## Desktop Grid

The primary 12-column system optimized for wide screens and high-resolution monitors.

MAX WIDTH  
1440px

GUTTERS  
24px

Our layout engine is built on mathematical precision. By adhering to a strict rhythmic grid, we ensure visual hierarchy and structural integrity across all digital canvases.

## 1. Authentication – Jobseeker Login:

The login experience is designed to create a strong first impression while maintaining clarity and trust. The left section focuses on aspirational messaging, highlighting career growth and platform credibility through testimonials and statistics, while the right section provides a clean and distraction-free login form. Users can easily switch between Jobseeker and

Recruiter roles, ensuring flexibility within the same platform. The inclusion of social login options like Google and GitHub reduces friction and speeds up onboarding, making the process quick and intuitive.

## 2. Authentication – Recruiter Login:

This version of the login screen is tailored specifically for recruiters, with messaging that emphasizes precision hiring and data-driven talent acquisition. The tone is more professional and outcome-focused, reinforcing trust and efficiency. Clear call-to-actions and minimal input fields ensure a smooth login experience, while the option to apply for a recruiter account encourages new users to onboard seamlessly. The layout maintains consistency with the jobseeker version while adapting content for a different audience.

## 3. Candidate Dashboard:

The candidate dashboard is designed to give users a clear overview of their progress and performance. It highlights key metrics such as completed tasks, overall performance score, and weekly progress, helping users stay motivated and goal-oriented. The inclusion of upcoming deadlines ensures users remain on track, while the leaderboard adds a competitive element to encourage engagement. Recent activity provides contextual feedback, making the experience feel dynamic and personalized.

## 4. Coding Challenges Listing

This page focuses on helping users explore and engage with technical challenges effectively. The layout uses a card-based system to present challenges with clear labels for difficulty, points, and participation. Filters such as difficulty level, language, and topic allow users to quickly find relevant tasks. The content emphasizes skill-building and real-world problem solving, making the platform feel valuable and career-focused. Strong call-to-actions like “Start Task” guide users toward immediate engagement.

## 5. Candidate Dashboard (Advanced Overview)

This version of the dashboard enhances personalization by welcoming the user and reinforcing their progress within the platform. It showcases performance insights, global ranking, and achievement tracking, creating a sense of accomplishment. The design balances analytical data with motivational elements, such as progress indicators and rankings, encouraging users to stay active and improve continuously.

## 7. Job Portal – Candidate Experience:

The job browsing experience is designed to be intuitive and personalized. Users can filter opportunities based on job type, salary range, and preferences, making job discovery efficient. Each job card highlights key details such as role, company, salary, and match percentage, helping users make quick decisions. The “Skill Match” feature adds value by encouraging users to improve their visibility through assessments. The layout ensures clarity while maintaining a clean and modern visual hierarchy.

## 8. Coding Challenges Listing:

The Technical & Design Challenges screen is designed to help recruiters efficiently manage and organize assessments through a clean, categorized interface. It separates technical and design challenges with filters, status tags, and difficulty levels, enabling quick navigation and decision-making while encouraging creation of new tasks through clear call-to-action elements.

## 9. Recruiter TOTAL HIRES:

This Success Stories screen showcases real hiring outcomes through a clean, mobile-friendly card layout that highlights winning candidates, roles, and key skills, building trust and credibility. The filter tabs (All Roles, Architecture, DevOps) enable quick exploration, while consistent “Read the case study” CTAs guide users toward deeper engagement with success narratives.

## 10. Switch to Desktop:

This screen clearly communicates a platform limitation by guiding users to switch from mobile to desktop for a better experience, using simple visuals and concise messaging. It reinforces the value through key benefits (IDE access, video interviews, complex workflows) and provides a helpful fallback CTA (“Email me a link”) to ensure continuity without frustration.

## 11: Application Detail:

This “My Applications” screen is designed for clarity and quick tracking, using status tags, filters, and summaries to help users monitor their job progress at a glance. The layout prioritizes actionable insights (interviews, active roles) while guiding users toward new opportunities through a prominent recommendation CTA.

## Conclusion:

The overall design of Hireldy presents a cohesive, end-to-end recruitment ecosystem that balances clarity, functionality, and user guidance across both recruiter and candidate experiences. From discovery and applications to assessments, interviews, and hiring decisions, each screen is thoughtfully structured with clear hierarchies, consistent components, and actionable CTAs that reduce friction and improve decision-making. The system emphasizes efficiency through dashboards, filters, and status tracking, while also supporting complex workflows like technical assessments and video interviews with contextual guidance (such as desktop prompts). Overall, the design successfully aligns user needs with business goals by creating a seamless, data-driven, and intuitive hiring journey.
